DETAILED ACTION

Allowable Subject Matter

Claims 1, 3 – 9, 11 – 16, 18 – 65 and 67 - 71 are allowed.

The following is a statement of reasons for indication of allowable subject matter.

The prior art fails to teach or suggest the limitations of:

“an online reverse auction...[with] an estimated market price stored in association with one or more of the [items up for auction]... wherein the estimated market price is formed as a function of historical pricing information not obtained via the online reverse auction environment, and wherein the estimated market price is not known to a vendor of the online reverse auction environment...updating [the estimated market price] after closing the online reverse auction.” (see Claim 1)

Such limitation is present in all independent claims.

It is old and well known in the art to conduct online reverse auctions. In a reverse auction, vendors or suppliers bid to secure a customer's business. Each bidder attempts to submit a lower bid than their competition with the customer's business ultimately being secured by the lowest cost provider.

It is also old and well known in the art to store an estimated market price in association with the item up for auction. The estimated market price is traditionally the

current winning bid, as the winning bid is the value that the marketplace places upon the item. This current winning bid is continually updated during the course of the auction, allowing for all auction participants to monitor the current winning bid for the item and their place in competition for the item.

Furthermore, it is also old and well known in the art for all bidders to know of the estimated market price, determined by the current winning bid, so that losing bidders may recalculate and resubmit new bidders with the hopes of securing the items up for auction.

The instant application distinguishes from these old and well known practices by neither formulating the estimated market price from the current bid submissions nor from continuously updating the estimated price market during the current auction. Rather the instant application formulates the estimated market price from historical data not submitted during the course of the current auction and updates the estimated market price only upon conclusion of the auction.

Additionally, the instant application distinguishes from these old and well known practices by not disclosing the estimated market price from the bidders in the auction. Instead, the instant application keeps the estimated market price from the bidders in the auction.

Alaia (US Patent 6,199,050) discloses a method/system for an online reverse auction. The disclosed online reverse auction continuously updates and discloses to all auction participants an estimated market price (current winning bid or market bid) generated through the continual submission of bids by the auction participants. (see col.

Art Unit: 3693

3, line 45 – col. 4, line 60). Neither this patent, alone nor in combination with others, discloses nor suggests the feature of generating an estimated market price from historical pricing information not obtained from the auction, keeping the estimated market price from bidders nor updating the estimated market price only after conclusion of the auction.

Culloton (Going, going...Mastro Fine Sports of Oak Brook Takes Online Auctions to Another Level) discloses a method/system for an online auction. Neither this non-patent literature, alone nor in combination with others, discloses nor suggests the feature of generating an estimated market price from historical pricing information not obtained from the auction, keeping the estimated market price from bidders nor updating the estimated market price only after conclusion of the auction.
